1. Overview

1.1. This Plan

This document provides a public summary of the Emergency Response Plan (ERP) for the Waratah Super Battery (WSB). It is intended to inform the local community, neighbouring landowners, and relevant authorities of the arrangements in place for managing emergency incidents at the site and how these arrangements interface with external stakeholders.

The Waratah Super Battery maintains a comprehensive Emergency Response Plan that establishes the framework for responding to potential emergency events. The plan defines the systems, responsibilities, and coordination arrangements required to manage incidents safely and effectively, with a focus on protecting people, the environment, and surrounding properties.

Emergency response at WSB is undertaken by trained site personnel and is supported by external emergency services, including Fire and Rescue NSW, NSW Ambulance, and NSW Police. The ERP provides for timely notification and coordination with these agencies to ensure that incidents are managed in accordance with established emergency management arrangements.

The plan also outlines how communication with external parties will occur in the event of an incident that may have the potential to impact areas outside the site boundary. This includes notification processes for neighbouring landholders where appropriate, as well as coordination with relevant authorities and emergency services to support broader community communication.

Where required, information will be provided to the community to ensure that affected parties are aware of the nature of the incident, any potential impacts, and any actions that may be recommended. The method and timing of communication will be dependent on the nature, scale, and potential off-site consequences of the event.

The Waratah Super Battery has been designed and is operated with multiple layers of safety systems and monitoring controls to minimise the likelihood of incidents and to support early detection and response. These controls form part of the overall emergency management framework described within the ERP.

This public document provides a summary of the emergency management arrangements at WSB. Detailed operational procedures and site-specific response actions are maintained within controlled internal documents and are not included in this version due to operational and security considerations.

1.2 Waratah Super Battery

The Waratah Super Battery (WSB), operated by Akaysha Energy Pty Ltd, is a grid-scale battery energy storage facility located at the former Munmorah Power Station site at Colongra, NSW.

The facility provides electricity system support services to the New South Wales power network.

A general location map is provided in Appendix A.

1.3 Objective of this Plan

The objective of this plan is to outline how emergency incidents at WSB are communicated to:

- Local communities and neighbouring landholders
- Relevant regulatory authorities
- Emergency services

This includes early notification, ongoing updates, and coordination with authorities in line with regulatory requirements.

---

2. Emergency Incident Notification

2.1 Immediate Notification to Relevant Authorities

In the event of an emergency incident that has the potential to impact human health, safety, or the environment, relevant authorities will be notified as soon as practicable, in accordance with regulatory requirements.

These may include:

- NSW Environment Protection Authority (EPA)
- NSW Health (Local Public Health Unit)
- Fire and Rescue NSW
- Local Council
- Other emergency services as required

Notifications will be made as soon as the situation is safe to assess and report.

Where known, information provided will include:

- Time, date, and location of the incident
- Nature of the incident and potential impacts
- Actions taken to manage the incident

Operational escalation processes and internal reporting systems are excluded from this public document.

---

3. Incident and Emergency Communications

3.1 Communication with the Local Community and Neighbouring Landholders

Where an incident occurs that may impact areas outside the site, reasonable steps will be taken to inform affected communities and neighbouring properties.

Communication will be coordinated with emergency services and regulatory authorities.

Communities considered for notification may include those:

- Adjacent to the site
- Within surrounding suburbs
- Identified as sensitive receivers (e.g. schools, healthcare facilities)

3.2 Communication Methods

Depending on the nature and scale of the incident, communication methods may include:

- Public information on company or authority websites
- Announcements via local media (radio or television)
- Direct notification (e.g. letterbox drops or targeted contact where appropriate)
- Emergency service alerts

Communication methods will be selected in consultation with emergency services and relevant authorities.

3.3 Emergency Communications and Public Safety Instructions

In situations involving an immediate risk to public safety, emergency services will lead the response and communication.

This may include:

- Evacuation instructions
- Shelter-in-place advice
- Restricted access to affected areas

All public safety instructions will be issued by emergency services or relevant authorities.

3.4 Notification Considerations

Decisions regarding community notification will consider:

- Nature and scale of the incident
- Potential off-site impacts
- Weather and environmental conditions
- Proximity of residential or sensitive properties

Not all incidents will require external notification where impacts are contained within the site.

4. Additional Information

- Emergency response activities will be coordinated with emergency services and regulatory authorities.
- Community updates will be provided as appropriate throughout the duration of an incident.
- Further information may be made available through official communication channels where required.
